

*Deviations of rated values at site altitudes > 1000 m*

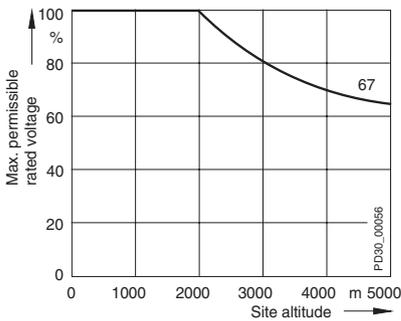

**Reduction of the rated voltage and rated current, depending on the site altitude and coolant temperature**

Deviation of the permissible direct current of rated direct current  $I_{dn}$ , or permissible alternating current of rated alternating current  $I_n$  (at coolant temperatures  $\neq 40^\circ\text{C}$ )  
 Characteristic curve 74 applies to reactors 4EU, 4ET, 4PK  
 Characteristic curve 72 applies to reactors 4EP, 4EM, 4EF11

Deviation of permissible direct current of rated direct current  $I_{dn}$ , or permissible alternating current of rated alternating current  $I_n$  (at site altitudes > 1000 m above sea level)

Reduction of rated voltage for insulation (at site altitudes > 2000 m above sea level)

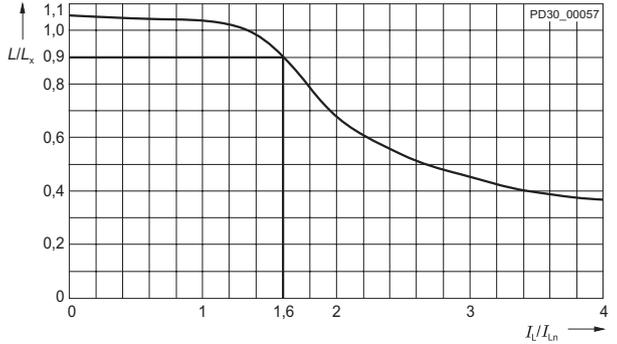

*Inductance curve*

**Commutating reactors and mains reactors**

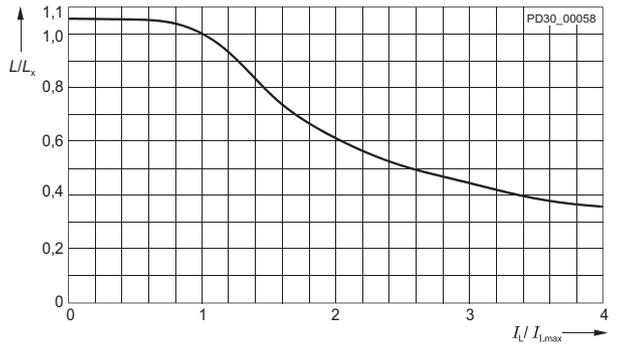

Commutating reactors and mains reactors differ greatly with regard to the inductance curve. The inductance is almost constant through to the rated current  $I_{Ln}$ ,

- Mains reactors still have 90% of their rated inductance at a 1.6-fold rated current  $I_{Ln}$ .
- Commutating reactors have a residual inductance of 60% at a 2.0-fold rated current  $I_{Ln}$ .

Typical inductance curves over the reactor current are shown in the following illustrations:

Typical curve of the inductance of a **mains reactor** over the reactor current

Typical curve of the inductance of a **commutating reactor** over the reactor current

### Voltage drop $\Delta U$ or reference voltage drop $u_D$

In the case of **three-phase reactors**, the voltage drop  $\Delta U$  per reactor phase when loaded with the maximum continuous thermal current  $I_{thmax}$  and line frequency  $f = 50$  Hz or 60 Hz.

The percent voltage drop  $u_D$  can be calculated using the following formula:

For converter connection B6

$$u_D = \frac{\Delta U \times 100 \times \sqrt{3}}{U_N} \quad \text{in \%}$$

The inductance per reactor phase is as follows:

$$L_x = \frac{\Delta U}{I_{thmax} \times \omega}$$

$$\omega = 2 \pi \times f$$

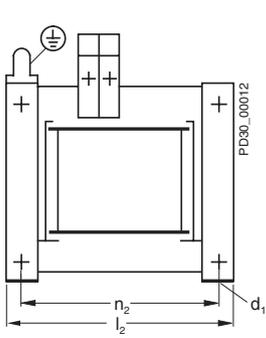

with  $f$  = line frequency (50 Hz or 60 Hz)

### Recommended supply voltage $U_N$ , reference voltage drop $u_D$ and insulation rating

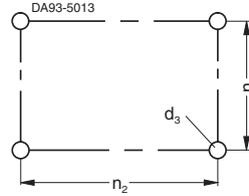

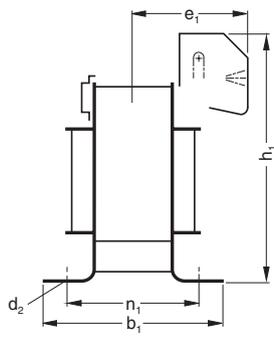

The "Selection and ordering data" table specifies a recommended supply voltage  $U_N$  for the reactors. The percent voltage drops  $u_D$  assigned to the reactors apply to the relevant recommended supply voltage  $U_N$ .

The rated voltage for the insulation specified in the "Selection and ordering data" table also allows the use of reactors at voltages that deviate from the recommended supply voltage  $U_N$ , but that are smaller or the same as the rated voltage of the insulation. The reference voltage drop  $u_D$  then changes and can be calculated using the formula shown in the Section "Voltage drop  $\Delta U$  or reference voltage drop  $u_D$ ".

A reactor with the reference voltage drop  $u_D$  specified as a percent value has the same effect on the system as a transformer with the same  $u_K$ .

4EM ≤ 40 A

Mounting holes

**Terminal 8WA9 200**

(for  $I_{dn} = 21$  A)

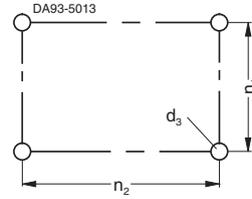

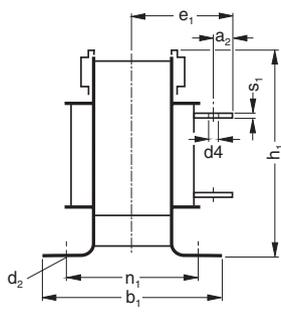

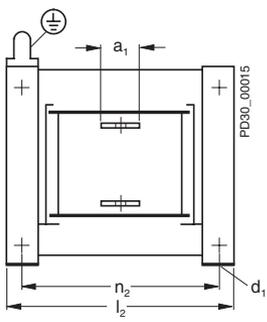

Cross-sections: solid: 0.5 mm<sup>2</sup> to 6 mm<sup>2</sup>  
finely stranded: 0.5 mm<sup>2</sup> to 4 mm<sup>2</sup>

**Terminal RKW110 or TRKSD10**

(for  $I_{dn} = 22$  A to 40 A)

Cross-sections: solid: 1 mm<sup>2</sup> to 16 mm<sup>2</sup>  
finely stranded: 1 mm<sup>2</sup> to 10 mm<sup>2</sup>
